

I would like to recommend to the FCC a definition of broadband to be forward-thinking into the future of voice and video over IP. This requires a minimum of 750Kbps SYMMETRICAL. Anything less is a bandaid. We are currently developing a broadband video application that will revolutionize communications. The applications are here, the fiber plant exists, we need a policy and enforcement over the last mile with guaranteed QOS. Pricing is also an issue. I pay \$47/month for a cable modem and they just cut my downstream speed in half without any warning or communication to me. Why is broadband so much cheaper overseas?

Sincerely,

Glenn S. Witherspoon
